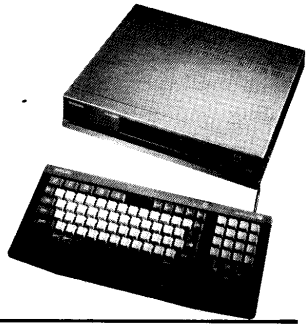
Service
Service
Service



Safety regulations require that the set be restored to its original condition and that parts which are identical with those specified be used

Service Manual

(GB) SPECIFICATION

Microprocessor	: Z80A
Memory	: 48k ROM 16k disk ROM 128k video RAM 128k user RAM
Video processor	: V9938
MSX controller	: S-3527
Floppy-disk drive	: 3.5", 1 MB
Interfaces	: RF output (UHF channel E36) Monitor output SCART Cassette recorder 2 joysticks Printer 2 cartridge slots
Keyboard	: QWERTY /00/16 AZERTY/19
Power supply voltage	: 220V ± 10%, 50Hz

(NL) SPECIFICATIE

Microprocessor	: Z80A
Geheugen	: 48k ROM 16k disk ROM 128k video RAM 128k gebruikers RAM
Videoprocessor	: V9938
MSX controller	: S-3527
Floppy-disk drive	: 3.5", 1 MB
Interfaces	: RF uitgang (UHF kanaal E36) Monitor uitgang SCART Cassette recorder 2 handbedieningen Printer 2 cartridge sleuven
Toetsenbord	: QWERTY /00/16 AZERTY/19
Voedingsspanning	: 220V ± 10%, 50Hz

(F) CARACTERISTIQUES TECHNIQUES

Micro processeur	: Z80A
Mémoire	: 48k ROM 16k ROM à disque 128k RAM vidéo 128k RAM utilisateur
Processeur vidéo	: V9938
Controle MSX	: S-3527
Lecteur de disquette	: 3.5", 1 MB
Interfaces	: Sortie RF (Canal UHF E36) Sortie monitor SCART Magnétophne cassette 2 poignées Imprimante 2 "slots" cartouche
Clavier	: QWERTY /00/16 AZERTY/19
Tension d'alimentation	: 220V ± 10%, 50Hz

(D) TECHNISCHE DATEN

Mikroprozessor	: Z80A

CAUTION

1. The exchange of cartridges should take place with the set turned off.

2. ESD

All ICs and many other semi-conductors are susceptible to electrostatic discharges (ESD). Careless handling during repair can reduce life drastically.
When repairing, make sure that you are connected with the same potential as the mass of the set via a wrist wrap with resistance.
Keep components and tools also at this potential.

ALIGNMENTS

RTC clock frequency

- Connect a frequency meter via a 10:1 probe to test point TP107 and connect the mass terminal of the probe with test point TP111.
- Set the frequency on TP107 to 32.768 kHz by means of VC101.

Analogue unit

1. Frequency

- Connect a frequency meter via a 10:1 probe to test point TP303 and connect the mass terminal of the probe with test point TP302.
- Using VC301, set the frequency on TP303 to 4.433619 MHz.

2. Burst

- Connect an oscilloscope via a 10:1 probe to test point TP301 and connect the mass terminal of the probe with test point TP302.
- Using VR301, set the time T2 of the burst signal (see figure 1) to 2.5 - 3 µs.
  T1 and T2 should then be 0.2 – 0.3 µs.

FDC

1. Read-pulse width

- Connect TP108 with TP109.
- Connect an oscilloscope via a 10:1 probe with TP106 and connect the mass terminal of the probe with TP109.
- Adjust the pulse width on TP108 for 0.5 µs by means of VR102, see figure 2.
- Interrupt the connection between TP108 and TP109.

2. VCO frequency

- Connect a frequency meter via a 10:1 probe to TP102 and connect the mass terminal of the probe with TP109.
- Switch the computer on.
- Connect TP108 with TP109.
- Using VR104, set the frequency on TP102 to 250 kHz.
- Interrupt the connection between TP108 and TP109.

Floppy Disk Drive

1. Required measuring equipment

- Dual trace oscilloscope, for example PM3211.
- Alignment disk, code nummer 4822 395 30274.
- FDD test cartridge, code number 4822 397 30135.

2. Use of the FDD test cartridge

- Switch the computer off and insert the FDD cartridge.
- Switch the computer on again.
- After start-up type: Poke&HFD9F,&HC9.
- Type: "CALL FDDTEST" and press the <RETURN> key.
- Select the disk drive test.
- The functions in the disk drive test are used for adjusting the disk drive.

3. Radial alignment

A) - Connect channel A of the oscilloscope via a 10:1 probe with test point TPN (for a survey of the test points, see figure 3.)
- Connect channel B via a 10:1 probe with test point TPP.
- Connect the mass terminal of the probe with GND.
- Oscilloscope alignments
  - Trigger externally with the index signal (IC140 pin 13 in the computer)
  - Sensitivity time basis 20 ms/div.
  - Sensitivity channel A and channel B: 5mV/div.
  - Invert channel B.
  - Add channel A and channel B.

B) - Place the alignment disk in the drive and read continuously track 40, side 0 (with <F3>).
- Check that the cat's eye pattern (see figure 4) is visible on track 40.
- If the correct cat's eye pattern is not visible, stop the reading action (with <ESC>).
- Loosen the screws A (see figure 3) of the stepping motor a quarter turn.
- Read track 40, side 0 continuously (with <F3>).
- Rotate the stepping motor (by means of a screwdriver in alignment point B, see fig. 3) until all lobes of the cat's eye pattern have the same amplitude.
- Tighten the screws A of the stepping motor again and check the cat's eye pattern once more. Repeat the alignment, if necessary.
- Stop the reading action with <ESC>.
- Read track 00, side 0 continuously (with <F3>) and increase the track number with the <CURSOR UP> key to track 40.
  Check the cat's eye pattern again.
- Stop the reading action (with <ESC>).
- Read track 79, side 0 continuously (with <F3>) and lower the track number to track 40 with the <CURSOR DOWN> key.
  Check the cat's eye pattern again.

4. Alignment track 00 sensor

Method 1

- Carry out point A of the radial alignment, however with the sensitivity of the time base at 5 µs/div.
- Place the alignment disk in the drive and read continuously track 00, side (0 with <F3>).
- Check whether a 62.5 KHz signal (a '1F' data pattern) is present on track 00.
- If the signal is not present, adjust the track 00 sensor until the 62.5 KHz signal will be visible.
- Check if the 62.5 KHz signal is only present on track 00 and not on track 01.

Method 2

- First check the radial alignment.
- Connect the input of the oscilloscope with test point TPT and ground.
- Read track 00, side 0 (with <F3>).
- Increase the track number to track 02 (with the <CURSOR UP> key) and measure the voltages across the track 00 sensor. These voltages should be:
  - 4.5V on track 00
  - 4.5V on track 01
  - 0 V on track 02
- If the measured values do not correspond with the values given above, decrease the track number by 1 to track 01.
- Adjust the track 00 sensor until the voltage across the sensor is 4.5 V at track 01.
- Check the voltages across the sensor at track 00, track 01 and track 02.
- Step to track 02 and lower the track number to track 00. Meanwhile check the voltage across the track 00 sensor at track 02, track 01 and track 00.

5. Azimuth inspection

- Carry out point A of the radial alignment, however with the sensitivity of the time base at 0.5 ms/div.
- Place the alignment disk in the drive and read continuously track 40, side 0 (with <F3>).
- Check the azimuth burst wave pattern (see figure 5).
- A tolerance of ±30' is allowed. Greater deviations may cause compatibility problems. The head unit cannot be adjusted further.

6. Index burst alignment

- Connect channel A of the oscilloscope via a 10:1 probe with test point TPN.
- Connect channel B via a 10:1 probe with the index signal (IC140 pin 13 in the computer).
- Connect the mass terminal of the probe, connected to channel A, with GND.
- Oscilloscope alignments:
  - Trigger on channel B.
  - Sensitivity time base: 0.1 ms/div.
  - Sensitivity channel A: 2mV/div.
  - Sensitivity channel B: 0.2V/div.
- Insert the alignment disk in the floppy drive and read track 40, side 0 continuously (with <F3>).
- Adjust VR2 for a period time T (see figure 6) of 400 ± 200 µs.

7. Side 1

- Check alignments 3 to 6 for side 1.

(NL)

WAARSCHUWING

1. Het uitwisselen van cartridges dient plaats te vinden bij een uitgeschakeld apparaat.

2. ESD

Alle IC's en vele andere halfgeleiders zijn gevoelig voor elektrostatische ontladingen (ESD). Onzorgvuldig behandelen tijdens reparatie kan de levensduur drastisch doen verminderen. Zorg ervoor, dat u tijdens reparatie via een polsband met weerstand verbonden bent met hetzelfde potentiaal als de massa van het apparaat. Houd componenten en hulpmiddelen ook op ditzelfde potentiaal.

INSTELLINGEN

RTC klokfrequentie

- Sluit via een 10:1 probe een frequentiemeter aan op testpunt TP107 en verbindt de massa van de probe met testpunt TP111.
- Regel de frequentie op TP107 af op 32,768 kHz door middel van VC101.

Analoge unit

1. Frequentie

- Sluit via een 10:1 probe een frequentiemeter aan op testpunt TP303 en verbindt de massa van de probe met testpunt TP302.
- Regel de frequentie op TP303 af op 4,433619 MHz door middel van VC301.

2. Burst

- Sluit via een 10:1 probe een oscilloscoop aan op testpunt TP301 en verbindt de massa van de probe met testpunt TP302.
- Regel de tijd T2 van het burst-signaal (zie fig. 1) af op 2,5 - 3 µs, door middel van VR301.
  T1 en T2 moeten dan 0,2 - 0,3 µs zijn.

FDC

1. Read-puls breedte

- Verbindt TP108 met TP109.
- Sluit via een 10:1 probe een oscilloscoop aan op TP106 en verbindt de massa van de probe met TP109.
- Regel de pulsbreedte op TP108 af op 0,5 µs door middel van VR102, zie figuur 2.
- Onderbreek de verbinding tussen TP108 en TP109.

2. VCO frequentie

- Sluit via een 10:1 probe een frequencymeter aan op TP102 en verbindt de massa van de probe met TP109.
- Schakel de computer in.
- Verbindt TP108 met TP109.
- Regel de frequentie op TP102 af op 250 kHz door middel van VR104.
- Onderbreek de verbinding tussen TP108 en TP109.
